Architecture

Project description

Arc Trade Escrow makes documentary trade programmable. Buyer and seller secure USDC, submit documentary evidence, and release value only when contract rules are satisfied. An arbitrator can resolve disputes; Circle Gateway handles authorized settlement.

Working MVP:	role-aware UI, milestone escrow, dispute/arbitration, relayer settlement.
--------------	---

Products

USDC | Circle Wallets | Circle Gateway | Arc Testnet

ARC TRADE ESCROW | SUBMISSION DETAILS

How the system works

Participants	Circle passkeys and smart accounts for buyer, seller, arbitrator.
Frontend	Reads Arc state and submits permitted calls; never calls Gateway.
Escrow contract	Stores roles, terms, deposits, milestones, release, disputes, arbitration.
Relayer	Polls events, persists settlement state, submits Gateway transfers, recovers responses.
Gateway	Moves custody and returns attestation required for minting.

Documentation

Repository README contains setup, deployment, verification, and integration notes.

Circle Product Feedback

Wallets provide a smooth passkey and gas-sponsored smart-account experience.

USDC gives predictable trade value; Gateway provides custody and settlement.

Improvement opportunity: clearer diagnostics for Client Key type, entity, domains,

Passkey Domains, and selected chain would make integration faster and more scalable.
